ABSTRACT:

The present study was designed to immunochemically identify a coronin-like protein in *Babesia bovis*, *B. bigemina*, *B. divergens*, and *B. canis*. A 2-kbp cDNA insert of *B...*

...protein. Polyclonal antibodies prepared in rabbits immunized with the purified GST-fusion protein recognized a *Babesia*-specific component of approximately 60 kDa by immunoprecipitation with [super(35)S]methionine-labeled parasites. However, two molecules with relative sizes of 60 and 70 kDa were recognized in *Babesia*-infected erythrocyte extracts by immunoblotting analysis. The 70-kDa component was apparently of host erythrocyte...

...fluorescent antibody test, the rabbit serum strongly reacted with the merozoite stage of the four *Babesia* species, but also, although weakly, with the host erythrocyte. A cosedimentation assay performed with GST...

...associated to actin. From these results, we conclude that the protein present in the four *Babesia* species analyzed here may be considered as a novel coronin-like, actin-binding protein.

...DESCRIPTORS: Fusion protein; Glutathione; Immunoprecipitation; Indirect fluorescent antibody test; Liver; Merozoites; Open reading frames; Parasites; Plasmids; *Babesia bovis*; *Canis*; *Plasmodium falciparum*

First molecular diagnosis of *Babesia vogeli* in domestic dogs from Turkey

Quelanber, Aynur; Gorenflot, Andre; Schetters, Theo PM; Carcy, Bernard

ABSTRACT:

... from Turkey revealed the presence of large (around 4.5-5.0  $\mu$ m)

babesia10563601.txt  
intraerythrocytic Babesia parasites in all dogs. DNA was extracted from the three infected blood samples and an around 410 bp portion of the 18 S rDNA gene of Babesia species was PCR amplified for subsequent molecular characterization. RFLP analysis of the PCR products suggested...

...isolates. Comparisons with the equivalent 410 bp portions of the 18 S rDNA gene of Babesia species confirmed the affiliation of these isolates to the B. vogeli species. This is the first report and molecular characterization of dog infection with a large Babesia species in Turkey.

Genetic basis for GPI-anchor merozoite surface antigen polymorphism of Babesia and resulting antigenic diversity.

... GPI-anchor (MSA) are proposed to act in the invasion process of infective merozoites of Babesia into host erythrocytes. Because of their essential function in the survival of Babesia parasites, they constitute good candidates for the development of vaccines against

babesia10563601.txt  
babesiosis and they have been extensively analyzed. These include Babesia bovis variable MSA (VMSA) and Babesia bigemina gp45/gp55 proteins of the agents of bovine babesiosis from tropical and subtropical countries, and the Babesia divergens Bd37 and Babesia canis Bc28 proteins of the main agents of bovine and canine babesiosis in Europe, respectively. However, these are very polymorphic antigens and Babesia parasites have evolved molecular mechanisms that enable these antigens to evade the host immune system.

... the antigenic diversity of B-cell epitopes that might be generated in each of these Babesia species. The picture is incomplete and no Babesia genome sequence is yet available. However, the available sequences suggest that two distinct, non cross...

... GPI-anchor MSA (i.e., with unique B-cell epitopes) may be required by all Babesia species for invasion, and that these two distinct GPI-anchor MSA would be encoded by a multigene family. Furthermore, the data are consistent with the ability of biological clones from Babesia to use these multigene families for the expression of GPI-anchor MSA, either conserved (B...

RECORD TYPE: Abstract

Identification of a coronin-like protein in Babesia species.

...AUTHORS: a); Precigout, Eric; Carcy, Bernard; Gorenflot, Andre

ABSTRACT: The present study was designed to immunochemically identify a coronin-like protein in Babesia bovis, B. bigemina, B. divergens, and B. canis. A 2-kbp cDNA insert of B...

...protein. Polyclonal antibodies prepared in rabbits immunized with the purified GST-fusion protein recognized a Babesia-specific component of approximately 60 kDa by immunoprecipitation with (35S) methionine-labeled parasites. However, two molecules with relative sizes of 60 and 70 kDa were recognized in Babesia-infected erythrocyte extracts by immunoblotting analysis. The 70-kDa component was apparently of host erythrocyte...

...fluorescent antibody test, the rabbit serum strongly reacted with the merozoite stage of the four Babesia species, but also, although weakly, with the host erythrocyte. A cosedimentation assay performed with GST...

...associated to actin. From these results, we conclude that the protein present in the four Babesia species analyzed here may be considered as a novel coronin-like, actin-binding protein.

Genetic basis for GPI-anchor merozoite surface antigen polymorphism of  
Babesia and resulting antigenic diversity.  
AUTHORS: Carcy, Bernard...

...ABSTRACT: GPI-anchor MSA are proposed to act in the invasion process of  
infective merozoites of Babesia into host erythrocytes. Because of  
their essential function in the survival of Babesia parasites, they  
constitute good candidates for the development of vaccines against  
babesiosis and they have been extensively analyzed. These include  
Babesia bovis variable MSA (VMSA) and Babesia bigemina  
gp45/gp55 proteins of the agents of bovine babesiosis from tropical and  
subtropical countries, and the Babesia divergens Bd37 and  
Babesia canis Bc28 proteins of the main agents of bovine and canine  
babesiosis in Europe, respectively. However, these are very polymorphic  
antigens and Babesia parasites have evolved molecular mechanisms  
that enable these antigens to evade the host immune system...

...the antigenic diversity of B-cell epitopes that might be generated in  
each of these Babesia species. The picture is incomplete and no  
Babesia genome sequence is yet available. However, the available  
sequences suggest that two distinct, non cross...

...GPI-anchor MSA (i.e., with unique B-cell epitopes) may be required by  
all Babesia species for invasion, and that these two distinct  
GPI-anchor MSA would be encoded by a multigene family. Furthermore, the  
data are consistent with the ability of biological clones from  
Babesia to use these multigene families for the expression of  
GPI-anchor MSA, either conserved (B...

RECORD TYPE: Abstract

First molecular diagnosis of *Babesia vogeli* in domestic dogs from Turkey.

...AUTHORS: a); Gorenflot, Andre; Schetters, Theo P.M.; Carcy, Bernard

...ABSTRACT: from Turkey revealed the presence of large (around 4.5-5.0 [mu]m) intraerythrocytic *Babesia* parasites in all dogs. DNA was extracted from the three infected blood samples and an around 410 bp portion of the 18 S rDNA gene of *Babesia* species was PCR amplified for subsequent molecular characterization. RFLP analysis of the PCR products suggested...

...Comparisons with the equivalent 410 bp portions of the 18 S rDNA gene of *Babesia* species confirmed the affiliation of these isolates to the *B. vogeli* species. This is the first report and molecular characterization of dog infection with a large *Babesia* species in Turkey. [copyright] 2006 Elsevier B.V. All rights reserved.

Identification of a Coronin-Like Protein in Babesia Species  
 Figueroa, Julio V; Precigout, Eric; Carcy, Bernard; Gorenflot, Andre

ABSTRACT:

The present study was designed to immunochemically identify a coronin-like protein in Babesia bovis, B. bigemina, B. divergens, and B. canis. A 2-kbp cDNA insert of B...

...protein. Polyclonal antibodies prepared in rabbits immunized with the purified GST-fusion protein recognized a Babesia-specific component of approximately 60 kDa by immunoprecipitation with [superscript 35]methionine-labeled parasites. However, two molecules with relative sizes of 60 and 70 kDa were recognized in Babesia-infected erythrocyte extracts by immunoblotting analysis. The 70-kDa component was apparently of host erythrocyte...

...fluorescent antibody test, the rabbit serum strongly reacted with the merozoite stage of the four Babesia species, but also, although weakly, with the host erythrocyte. A cosedimentation assay performed with GST...

...associated to actin. From these results, we conclude that the protein present in the four Babesia species analyzed here may be considered as a novel coronin-like, actin-binding protein.

Identification of a coronin-like protein in Babesia species.  
...AUTHORS: a); Precigout, Eric; Carcy, Bernard; Gorenflot, Andre

ABSTRACT: The present study was designed to immunochemically identify a  
coronin-like protein in Babesia bovis, B. bigemina, B. divergens,  
and B. canis. A 2-kbp cDNA insert of B...

...protein. Polyclonal antibodies prepared in rabbits immunized with the  
purified GST-fusion protein recognized a Babesia-specific component  
of approximately 60 kDa by immunoprecipitation with (35S)  
methionine-labeled parasites. However, two molecules with relative sizes  
of 60 and 70 kDa were recognized in Babesia-infected erythrocyte  
extracts by immunoblotting analysis. The 70-kDa component was apparently  
of host erythrocyte...

...fluorescent antibody test, the rabbit serum strongly reacted with the  
merozoite stage of the four Babesia species, but also, although  
weakly, with the host erythrocyte. A cosedimentation assay performed with  
GST...

...associated to actin. From these results, we conclude that the protein  
present in the four Babesia species analyzed here may be considered  
as a novel coronin-like, actin-binding protein.

RECORD TYPE: Abstract

Genetic basis for GPI-anchor merozoite surface antigen polymorphism of Babesia and resulting antigenic diversity.

...AUTHORS: a); Precigout, Eric; Schetters, Theo; Gorenflot, Andre

...ABSTRACT: GPI-anchor MSA are proposed to act in the invasion process of infective merozoites of Babesia into host erythrocytes. Because of their essential function in the survival of Babesia parasites, they constitute good candidates for the development of vaccines against babesiosis and they have been extensively analyzed. These include Babesia bovis variable MSA (VMSA) and Babesia bigemina gp45/gp55 proteins of the agents of bovine babesiosis from tropical and subtropical countries, and the Babesia divergens Bd37 and Babesia canis Bc28 proteins of the main agents of bovine and canine babesiosis in Europe, respectively. However, these are very polymorphic antigens and Babesia parasites have evolved molecular mechanisms that enable these antigens to evade the host immune system...

...the antigenic diversity of B-cell epitopes that might be generated in each of these Babesia species. The picture is incomplete and no Babesia genome sequence is yet available. However, the available sequences suggest that two distinct, non cross...

...GPI-anchor MSA (i.e., with unique B-cell epitopes) may be required by all Babesia species for invasion, and that these two distinct GPI-anchor MSA would be encoded by a multigene family. Furthermore, the data are consistent with the ability of biological clones from Babesia to use these multigene families for the expression of GPI-anchor MSA, either conserved (B...

Turkey.

...AUTHORS: a); Gorenflot, Andre; Schetters, Theo P.M.; Carcy, Bernard

...ABSTRACT: from Turkey revealed the presence of large (around 4.5-5.0 [μm]) intraerythrocytic Babesia parasites in all dogs. DNA was extracted from the three infected blood samples and an around 410 bp portion of the 18 S rDNA gene of Babesia species was PCR amplified for subsequent molecular characterization. RFLP analysis of the PCR products suggested...

...Comparisons with the equivalent 410 bp portions of the 18 S rDNA gene of Babesia species confirmed the affiliation of these isolates to the B. vogeli species. This is the first report and molecular characterization of dog infection with a large Babesia species in Turkey. [copyright] 2006 Elsevier B.V. All rights reserved.

Babesia divergens: Cloning of a Pan binding protein 1 homologue.

...AUTHORS: a); Schetters, Theo; Gorenflot, Andre

ABSTRACT: Babesia divergens is an Apicomplexa transmitted to bovines by its acarian vector, the tick I. ricinus. Babesia divergens merozoites have an intraerythrocytic development in the blood of infected mammals. The nucleocytoplasmic transport...

Babesia canis canis, Babesia canis vogeli, Babesia canis  
rossi: Differentiation of the three subspecies by a restriction Fragment  
length polymorphism analysis on...

Carret, C; Valas, F; Carcy, B; Grande, N; Precigout, E; Mubri,  
K; Schettters, TP; Gorenflot, A\*

ABSTRACT:

The parasites Babesia canis and Babesia gibsoni (phylum  
Apicomplexa) are responsible for canine babesiosis throughout the world.  
Babesia canis was previously described as a group of three  
biologically different subspecies, namely B. canis...

...with primers derived from a semi-conserved region of the ssu-rDNA genes  
in other Babesia species. The polymerase chain reaction combined with  
a restriction fragment length polymorphism analysis, using HinfI...

...B. canis into three subspecies. These sequences were compared with  
previously published sequences of other Babesia species. A  
phylogenetic approach showed that the three subspecies of B. canis belong  
to the clade of Babesia species sensu stricto where B. canis canis  
clusters with B. canis rossi whereas B. canis...

DESCRIP TORS: Phylogeny; rRNA; Restriction fragment length polymorphism  
babesiosis; Babesia canis canis; Babesia canis vogeli;  
Babesia canis rossi; Babesia canis; Babesia gibsoni
